

APPLICATION

Various operation accessories are available for use with penstocks, adjustable weirs and other KWT equipment, whether for manual or electrical operation. All accessories are designed to be easy to use and vandal resistance.

Half-Moon Connection

This is the standard operation connection for KWT equipment, when using removable cranks e.g. T Keys and S Cranks. The design of the Half-Moon is ideal for use in vandal prone areas, as it can only be used with the correct KWT Crank.

Actuator Connection

The actuator connection is used for various types of actuators, or where a gearbox is required. The connection is permanently fixed, and can be made in a number of sizes.

Tapered Square

The Tapered Square connection is used with KWT HDPE handwheels, allowing it to be removed when not in use. This type can also be used with a T Crank if required.

Spindle Extensions/Pedestals

ACE can supply spindle extensions to position the operation point at a comfortable level for the user. These are available in various lengths, and are telescopic, allowing for up to 500mm of adjustment. Pedestals can also be supplied when using handwheels and actuators for further operator comfort. All items are supplied with fixings.
